

How sensitive is the recommendation to planning assumptions?

Assumption robustness check

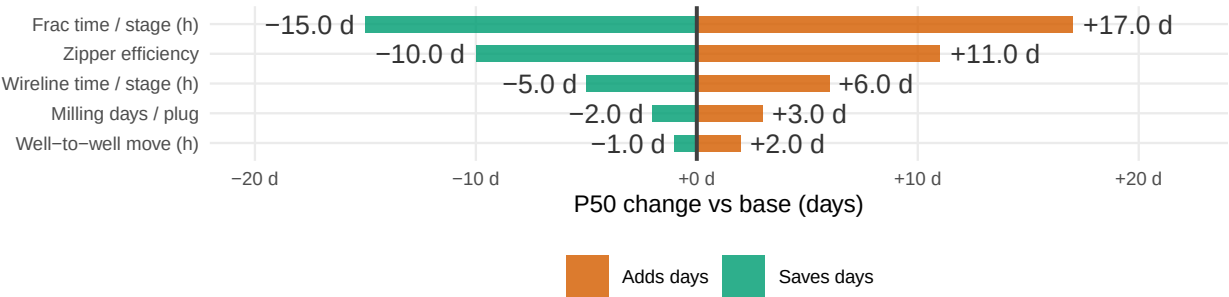

One-at-a-time: base recommendation "Add 1 frac fleet" flips under a +-15% swing in 1 of 5 assumptions (n=150 iteration)

Combined stress case (all 5 assumptions +-15% unfavourable together): recommendation unchanged, P50 +28.0 d vs base

Scenario	P50 (d)	P90 (d)	Delta P50 (d)	Readiness	Recommendation	Vs. base
Best case	95	110	-25.0	82 (Ready)	Add 1 frac fleet	Unchanged
Base case	120	138	+0.0	74 (Ready)	Add 1 frac fleet	Unchanged
Stress case	148	170	+28.0	61 (Caution)	Add 1 frac fleet	Unchanged

Assumption sensitivity – P50 impact of a ±15% swing

Base P50 = 120 d – wider bar = assumption has more influence on the schedule

Recommendation flips in 1 assumption(s) under a ±15% swing – see table below.
